giuseppe.serazzi@polimi.it

Outline

❑ Evolution of PE discipline

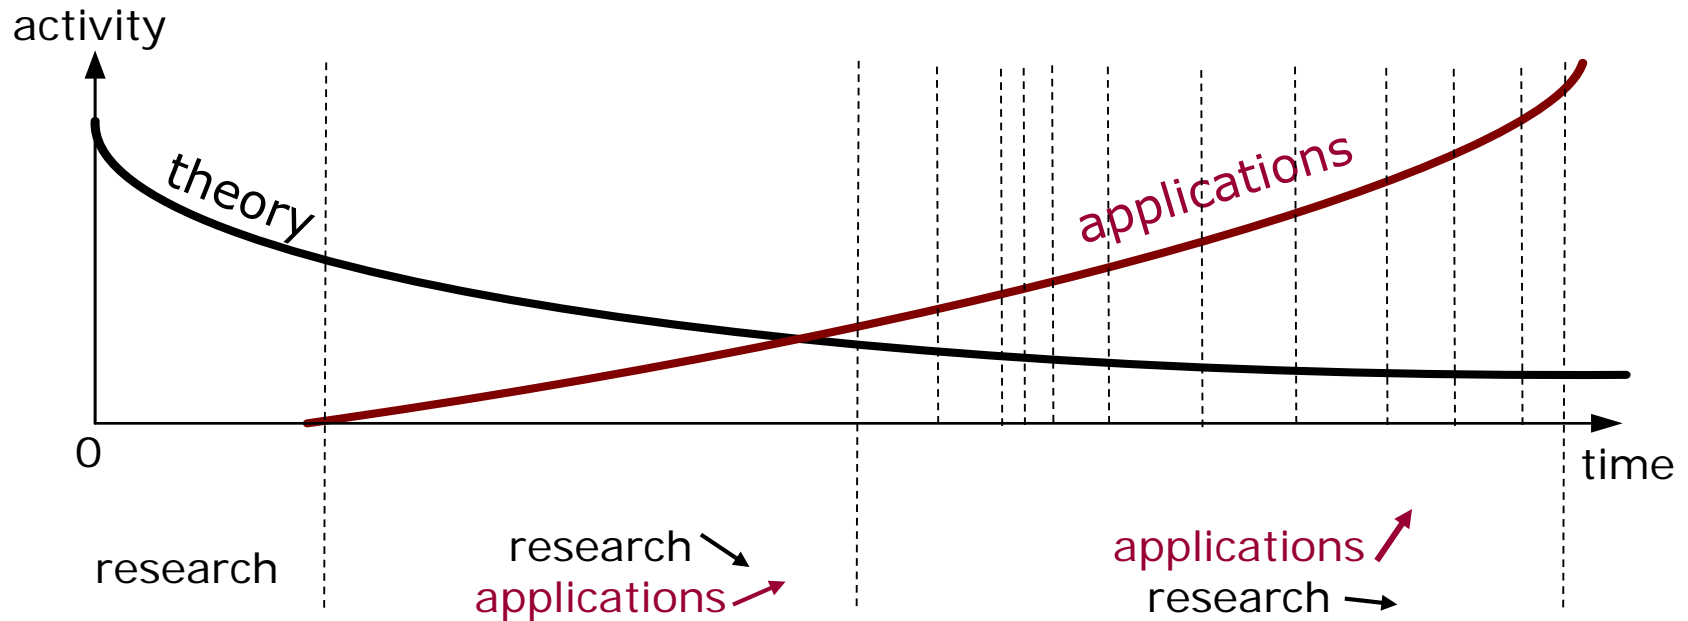

- ❑ Prior to 1970
- ❑ 1970 – 1980
- ❑ 1980 – 2000
- ❑ The last 20 years

❑ Evolution of PE textbooks

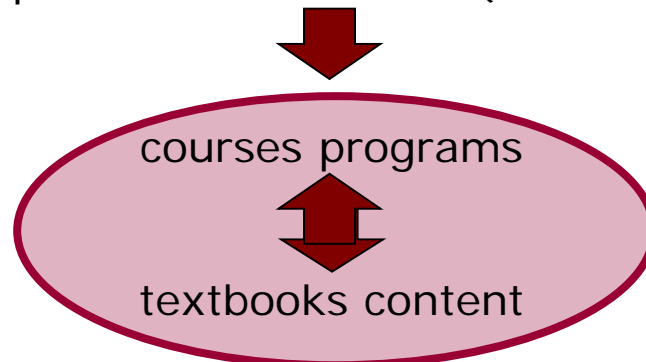

- ❑ Prior to 1960
- ❑ 1960 - 1980
- ❑ 1980 – 2020

❑ 2021 Learning PE Through Applications

Phases in the evolution of a discipline

activity: research, research & early applications,
applications & research (balanced)

Evolution of Performance Evaluation (PE) discipline

Impact on titles of textbooks

1900-50s probability, stat., stochastic proc., Markov Ch., Queueing Networks, Petri Nets, ...

.....
1975 Queueing Systems, Vol.1: Theory, Kleinrock

1976 Queueing Systems, Vol.2: Computer **Applications**, Kleinrock

1976 Fundamental laws of computer system performance, Buzen

1978 Computer Systems Performance Evaluation, Ferrari

1978 Modeling and Analysis: An introduction to PE Methodology, Kobayashi

1980 Computational algorithms for closed queueing networks, Bruell, Balbo

1981 Computer Systems Performance Modeling, Sauer, Chandy

.....

1982 Probability and statistics with Reliability, Queueing and **CS Applications**, Trivedi

1983 Simulation of Computer **Communication Systems**, Sauer, Macnair

1983 **Measurement and Tuning** of Computer Systems, Ferrari, Serazzi, Zeigner

1984 **Quantitative System Performance**: Computer System Analysis using QN, Lazowska ...

1990 Performance Engineering of **Software Systems**, Smith

1990 The **Art** of Computer Systems Performance Analysis, Jain

1994 **Capacity Planning** and Performance Modeling, Menasce, Almeida, Dowdy

2000 **Scaling for e-business**, Menasce, Almeida

2002 **Capacity Planning for Web Services**: metrics, models, and methods, Menasce, Almeida

.....

2006 Queueing Net. and Markov Ch.: **Modeling and Perf.Evaluation with CS App.**, Bolch et.al

2008 Performance **Modeling and Engineering**, Xia Ed.

2010 **Analytical Performance Modeling** for Computer Systems, Tay

2010 Performance Evaluation of Computer and **Communication Systems**, Le Boudec

2013 Performance Modeling and **Design of CS: Queueing Theory in Action**, Harcol-Balter

2013 Prob., Stoc.Proc., Queueing Th.: the Math. of **Computer Performance Modeling**, Nelson

.....

PE: the current situation *

- ❑ in the 70's PE officially became a **separate** discipline
- ❑ fifty years later there is a new world: centers with **thousands** of servers, **millions** of users, **web services** and **apps** for **any need..**
- ❑ today PE plays a **crucial role** in **people's daily lives** and in **business** that it has never had before

BUT 

- the **credits** for teaching PE courses are **decreasing**
- the **budgets** for PE projects are **squeezed**
- the PE **students** are **continuously reducing** because
 - **more attracted** by courses with trendy names: ML, AI, Big Data ...
 - **lack of interest** (see next slides)

* see V. de Nitto Persone', *Teaching Performance Modeling in the era of millenials*, JOURNAL OF LATEX CLASS FILES, arXiv:arXiv:2001.08949v1 [cs.CY], Jan 2020.

common core to most books

- ❑ despite the differences in emphasis of the various topics, there is a characteristic **common** to most textbooks: the **large parts** dedicated to the **core disciplines** (prob., stat., stoc. proc., Markov Chain, Queueing Net., Petri Nets, ...)
- ❑ the weight of the **theoretical** parts is almost always **much greater** than that of the **applications**
- ❑ furthermore, even to varying degrees, a good number of books dedicate (more or less consistent) parts to the description of **obsolete notions/techniques/case studies**

THUS

PE courses are often perceived as **too theoretical** and **too far** from **reality**

unbalanced growth of theoretical parts

- ❑ **huge bulk** of material (books, slides) on the core disciplines has been accumulated over decades (**ready to be used**)
- ❑ consequently, it takes a **very short time** to prepare a lesson on these topics (which prof have been teaching for years) compared to that necessary to prepare **new lessons on apps**
- ❑ **rapid obsolescence** of the practical applications compared to the **stability over time** of the basic notions of core disciplines
- ❑ tendency of some prof to demonstrate their **deep knowledge** by teaching an **excessive amount** of **mathematical detail**, often **useless**, leaving little time for lessons on other topics
- ❑

piggybacking old material in new books (legacy of the past)

reuse of old material, often useless or obsolete, is common

- ❑ e.g., some **old algorithms** and **solution techniques** are still taught but few (if any) students will implement them as there are tools open source that have these features
- ❑ **SIMULATION**: is the **longest** adopted technique for solving PE models, used from the **60s to today**. First professional simulators appeared in the early 70s (Scert, Case, ...).
- ❑ Today highly **reliable** and **efficient** simulators are distributed **open source**, and thus very **few** students (**if any**) will need to implement a simulator
- ❑ **but, several books still** have chapters on the **implementation of simulators** and related problems: transients, conf.intervals, equilibrium, ... (and thus several **lessons** are devoted to them)

Learning PE Through Applications (LTA)

to build modeling skills it is necessary to accumulate experiences that can only be learned through trial and error work by solving problems of varying difficulties

- ❑ LTA introduce students **gradually** in PE topics by considering problems of **increasing complexity**
- ❑ concepts will be learned **indirectly** step by step (bottom-up) while **solving problems**
- ❑ **unnecessary** exposure of math concepts must be **minimized**
- ❑ lectures must be **focused** on PE topics; theoretical parts, if necessary, must be followed by **case studies** with their **apps**
- ❑ **new** data **presentation** techniques must be applied as much as possible, e.g., graphics , animations, ...

to implement LTA and improve PE acceptance

- ❑ **drastic reduction** of theoretical descriptions (of core disciplines and techniques) in textbooks and lessons
- ❑ describe **applications** by extracting from real case studies **only** the parts most relevant to performance (to **reduce** model **complexity**)
- ❑ PE problems facing **industries** cannot be described in detail in a course, but the most **appropriate methodologies** for their solutions can be **taught**
- ❑ a **reference book** with a **collection** of case studies of **various modelling difficulties, solution techniques, methodologies, ...** , would be most welcome

and

- ❑ to **attract students, integrate popular CS** courses with few lessons on PE **basic concepts** and **simple case studies**

Animation 1: arrival and service rate, queue, JMCH

<http://jmt.sourceforge.net> JMT Tools

Simulation Parameters

Avg. Arrival Rate (λ) = 0.50 cust./s Avg. Service Time S = 1.90 s

Simulation Results

Avg. Cust. in Station (Queue + Service) N = 19.00 cust. Avg. Utilization (Sum of All Servers) U = 0.95
Avg. Throughput X = 0.50 cust./s Avg. Response Time R = 38.00 s

States of the Markov Chain

Legend:
■ probability
■ queue
■ current state

0.049 0.047 0.045 0.042 0.040 0.038 0.036 0.000

queue length

Legend:
■ current queue
■ dropped customer
■ avg. utilization

executing cust.:57, residual time:5290ms

cust. in the station:6 change view

Simulation time **Customers**

Time x50.00 total customer arrived: 62

Animation 2: response time with two-class workload

2 customers, 2 classes, 2 resources

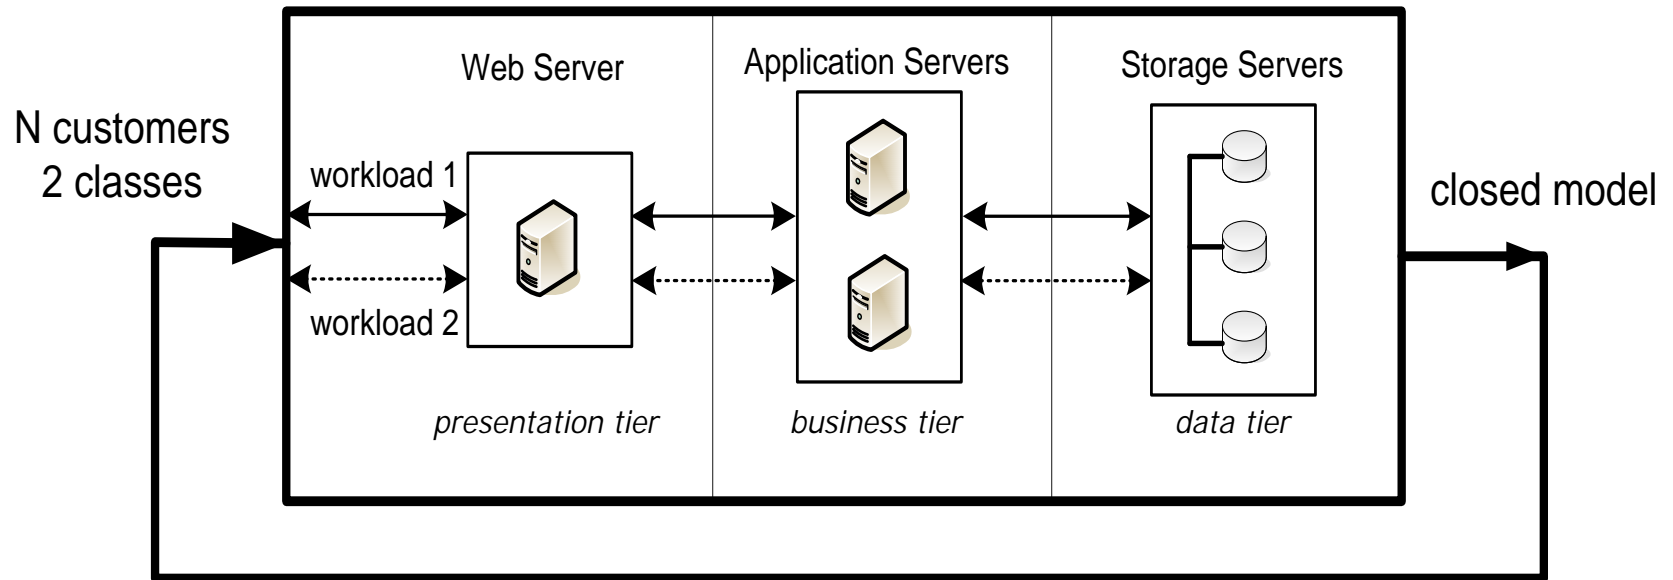

a, b, c, d
rates of execution

visual demo: system response time R is NOT the **arithmetic mean** but is the **weighted mean** of the response times of the classes (the weights are the relative throughputs)

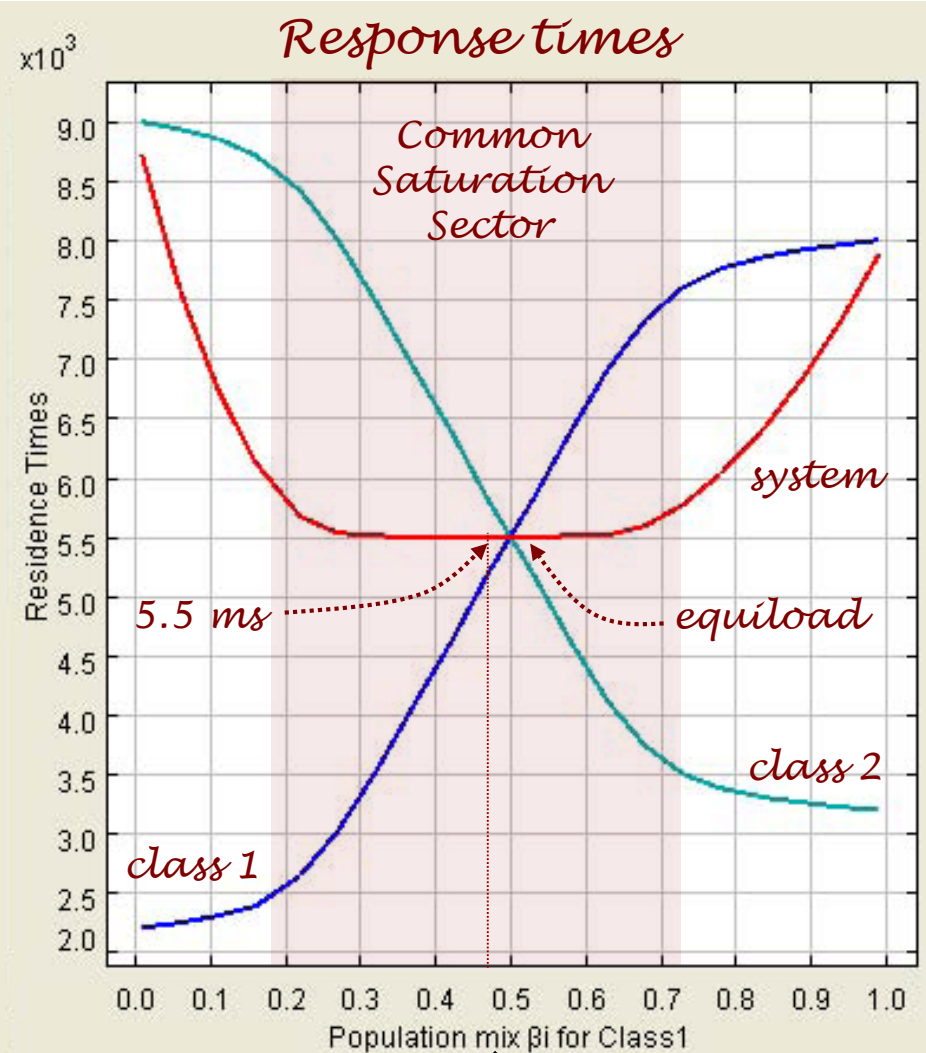

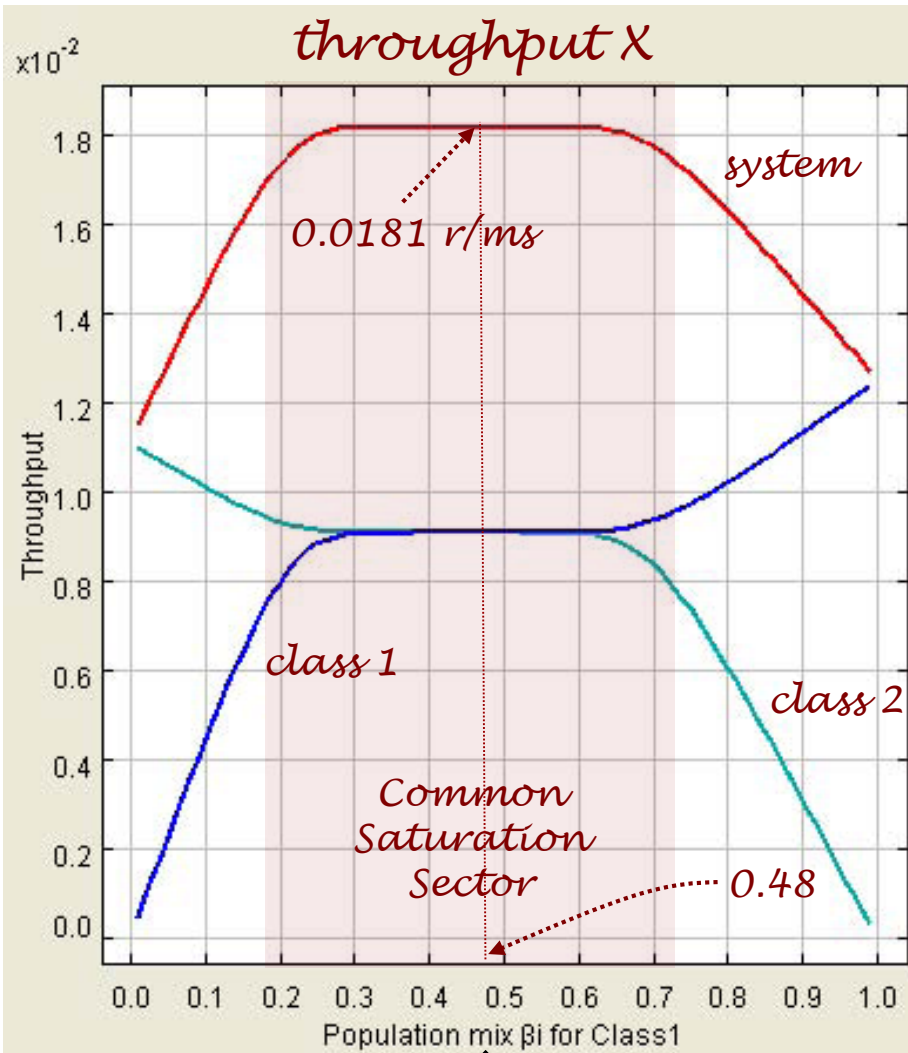

$$R_0 = R_1 \frac{X_1}{X_0} + R_2 \frac{X_2}{X_0}$$

data center – 2 class workload
